Subject: Collective behaviour & behavioural-state modelling — a quick hello

Hi Eduardo,

I read "Multidimensional social influence drives leadership and composition-dependent success in octopus-fish hunting groups" and wanted to reach out — the way you model leadership and composition effects in mixed-species hunting groups is close to what I spend my time on: characterising strategy shifts and latent behavioural states in animal decision-making.

I'm Adonai Gil, a contracted research assistant in the Animal Minds lab at the Universitat Autònoma de Barcelona (PI: Alex Taylor). For my master's thesis I combined hierarchical Bayesian models in R (brms, bayestestR, tidybayes, bayesplot, emmeans) with GLM-HMM latent-state analysis to characterise an animal's decision strategies in a two-alternative task, validated behaviourally — the thesis report was graded above 9.5/10. I also trained several DeepLabCut models for data collection and built a post-processing pipeline for coordinate and optical-distortion correction.

Would you have 15-20 minutes for a short call to talk about your work on collective behaviour and see whether there's any scope for collaboration or a way I could contribute? I'm not assuming there's an open position — just keen to hear more about how you're approaching multi-agent behavioural dynamics.

I know this may not be the right moment, and that's completely fine — a quick "not now" is a perfectly good answer. If it's easier, I'm happy to send a one-page summary of my work first instead of a call.

Best,
Adonai Gil

P.S. Happy to share my thesis report or the R/GLM-HMM code if useful.
